The SC5510A is a single PXIe Slot, high performance VCO based synthesized signal source with frequency ranging from 100 MHz to 20 GHz. Despite its small single slot PXI form factor, it packs the instrument grade performance of large box instruments. Boasting low phase noise of -115 dBc/Hz @ 10kHz offset from a 10 GHz carrier, tuning the entire band at 1 Hz resolution, and having amplitude step resolution of 0.01 dB over the range of -30 dBm to 10 dBm sets the SC5510A apart from other small modular synthesizers. Furthermore, using a unique multiple phase-locked loop architecture the phase spurs are typically kept below -65dBc across the tuning range, even at 1 Hz step resolution. Furthermore, using a high fundamental frequency VCO (20 GHz) and eliminating multipliers, sub-harmonics due to dividers are typically less than -70dBc and far out spurious signals are also kept below -70 dBc.

The SC5511A has an additional independent RF2 channel whose frequency range covers 100 MHz to 3 GHz with tuning resolution of 25 MHz. This makes the module ideal for both single-stage RF conversion systems, and dual-stage image suppression up/down converter systems. It makes a great general purpose laboratory signal source where demanding low phase noise and signal purity are needed. It is also an ideal choice as an integrated clock source for fast DAC and ADC applications, especially those that require variable sampling rates.

Specifications are subject to change without notice. For the most recent product specifications, please visit www.signalcore.com.

(1) Internal reference is a TCXO. For better accuracies and stability SignalCore recommends phase-locking to a precision external source.
(2) For step change of less than 100 MHz and only when automatic amplitude adjustment is turned off.
(3) Specified for channel RF 1 at power levels of greater than 0 dBm.
(4) Output level range is typically -30 dBm to +13 dBm for frequencies <18 GHz. The leveled range is typically -30 dBm to +10 dBm for frequencies >18 GHz.
(5) Output levels ≤ -22 dBm, may degrade to ±2.0 dB typical at some frequencies.
(6) The PXIe chassis must be capable of cooling 30W per module slot under these temperatures.
